

Classic TIME Template: Data and Protocol Overview

1 Dataset scope

The template covers Electricity, Traffic, Solar-Energy, Weather, Exchange Rate, ETTh1, ETTh2, ETTm1, and ETTm2; PEMS is excluded. Each panel is converted once into TIME's multivariate saved-Arrow representation. Source configuration controls targets, exclusions, aggregation, and missing-value handling.

2 Shared supervised contract

Children will train only on chronological training observations, select models using validation observations, and evaluate on held-out test windows. The split borders, horizon set, lookback lengths, sampling stride, target mode, objective, and seed grid remain intentionally unspecified because they define the scientific comparison and must be selected before training code is added.

3 Ownership

This repository owns reusable classic-data preparation and loading. Descendant repositories own TimeTensors-, RevIN-, PatchTST-, DLinear-, or other scientific experiments and retain their own logs, outputs, reports, and conclusions.
